CORPORATE PROFILE

Alternate Energy Technologies, LLC (AET) is a Florida based corporation specializing in the manufacturing of flat plate solar thermal collectors. AET offers its international network of Distributors and Representatives unparalleled equipment in both thermal output and structural integrity while maintaining customer support programs second to none.

Strategically located in Jacksonville, Florida AET has excellent availability to interstate highways, rail connections, and a deep-water port assuring prompt, dependable shipments. An experienced Engineering Department assists clients in design engineering and, if requested, on site project management. These services are available both to AET’s domestic customers as well as international agents and distributors.

The Officers and Directors of AET offer an unusually strong knowledge of today’s energy industry with over 100 years collectively of leadership experience in the solar industry.

AET markets its products under the trade names of Morning Star, Cornerstone, American Energy and U.S. Solar Corporation, the manufacturer of Eagle Sun™ solar thermal products.

An ongoing R & D effort with AET in new product development material research and manufacturing process is among the most aggressive in the solar industry today. These efforts will assure AET customers worldwide a competitive advantage in an ever-changing solar industry.

AET additionally packages entire systems that include fluid handling modules and storage vessels for residential, commercial and industrial clients. Over 100 systems are certified by the Florida Solar Energy Center and all collector models are certified by Solar Rating Certification Corporation (SRCC), assuring our customers with the most appropriate technology for their applications. Absorber plates manufactured by AET,Thermafin are well known throughout the world for their exceptional thermal characteristics and durability. Many models are available such as standard, non-standard and various OEM absorbers.

For additional information, please do not hesitate to call AET.
CORPORATE OVERVIEW

Since 1977 Alternate Energy Technologies, LLC (AET) and its subsidiaries have been pioneers in the solar industry in the USA. AET has manufactured and sold over 500,000 collectors worldwide through its international network of Dealers, Distributors and Agents.

Today, AET business activity in the solar industry has grown into six major product groups.

1. Solar Collectors – AET presently markets its manufactured solar collectors under the trade name of US Solar Corporation, Morning Star and Alternate Energy. With 30 models available, the AET product line is among the most extensive available from a single supplier worldwide.

Recognized for their high performance, structural integrity and patented mounting systems, AET, Morning Star™ and US Solar Corporation Eagle Sun™ collectors are often specified by utility companies as well as local, state, and federal government agencies. AET solar collectors meet or exceed all know state and federal codes including Dade County Florida hurricane wind loading requirements (84 psf, 181 mph). AET collector thermal performance has been certified by the Florida Solar Energy Center (FSEC) and the Solar Rating and Certification Corporation (SRCC) in the US. Foreign certifications/approvals have been obtained in Korea, Confederation of Independent States, Sweden, and Morocco to name a few.

2. Solar Absorber Plates manufactured by AET/Thermafin are distributed worldwide. Thermafin’s proprietary forge welding process of bonding the copper tube to the copper absorber sheet is designed to assure optimal heat transfer characteristics while offering long term dependable service. AET offers its absorbers to OEM buyers in 30 “standard” configurations as well as offering “custom” absorbers to its clients’ specifications.

3. Crystal Clear Selective Coating exclusively from Thermafin Manufacturing. Selective coated forge welded copper fin tubes are supplied to solar manufacturers worldwide. Thermafin guarantees the forge weld between copper fin and copper tube for 30 years. Crystal Clear electroplated copper coil is also supplied to OEM solar manufacturers in 18 countries.

4. Eagle Sun™ Systems are available for residential, commercial and industrial applications. Over 100 residential systems, both active (pumped) and passive (no pumps) are certified by Florida Solar Energy Center. Eagle Sun™ Systems have been installed for over 25 years in climates ranging from the tropical Caribbean to the harsh winters of Nepal. The staff of AET includes engineers, accountants and managers thoroughly familiar with all facets of design and economic analysis assuring the most appropriate system for the application yielding long-term performance and maximizing the return on investment of the solar system. Eagle Sun™ Systems meet or exceed all applicable national, state and local solar water heating codes. Eagle Sun™ Systems exceed HUD February 1991 solar standards and have been the choice of major homebuilders such as Centex Homes Inc. and US Homes.

Eagle Sun™ Commercial and Industrial Systems by US Solar Corporation have been in successful operation for over 25 years. Factory engineered and packed systems by AET staff engineers can be successfully applied to meet most any load cost effectively in any climate zone from small commercial installations of 500 – 2000 gallons to large industrial applications of 2000 – 10,000+ gallons. In addition to engineering and design services for the commercial sector, AET offers on site project management. AET will guarantee the thermal performance of Eagle Sun™ Systems, when designed and installed under supervision by AET personnel.

5. Manufacturing Technology by AET yields high output, low labor input and maximum utilization of raw materials and low energy consumption within its process. AET’s state of the art manufacturing process has undergone 27 years of continual engineering resulting in proprietary manufacturing technologies and equipment unique to AET.

Raw material procurement from world markets was integrated within AET’s manufacturing in 1989 enabling AET to maximize utilization of facilities and minimize the cost of goods. Quality control and quality assurance are also an added benefit in AET’s manufacturing process.
In 1981, US Solar Corporation introduced an SKD series solar collector for export outside of the United States. The SKD program has grown through the years and it is currently being utilized in over 12 countries around the world. At present, AET is finalizing negotiations for joint venture partnerships for the manufacture and utilization of SKD collectors in a number of countries.

As a component of the SKD program and Technology Transfer program, AET provides training of key personnel at AET headquarters and the respective country. Continuing education, updating the manufacturing technology and installation techniques, as well as introducing new products are also provided to AET clients.

6. Research and Development – The R & D department consists of professional engineers, researchers and managers exploring new product development in the solar thermal field.

Presently R & D is ongoing in two primary areas.

1. High Performance flat plates utilizing insulating glazing materials enabling AET collectors to operate efficiently in the 195°F to 230°F temperature range.

2. New insulation material to be integrated into AET flat plates to achieve higher side and rear collector insulation values at reduced costs.

AET products have been regarded as America’s premier solar thermal equipment. With over 30 collectors and 120 systems fully test/approved, AET solar products will provide many years of reliable energy savings.

Additionally, AET offers:

- Residential, Commercial and Industrial Systems of any size
- Sales and Marketing Programs
- Full Engineering Support Services
- Worldwide distribution assuring dependable prompt service

CERTIFICATIONS AND APPROVALS

- Solar Rating and Certification Corp. – Test Methods and Minimum Standards for Certifying Solar Collectors, Standard 100-81
- Florida Solar Energy Test Methods and Minimum Standards for Solar Collectors, FSEC, 1981
- City of Los Angeles Mechanical Testing Lab, Approval No. RR-4338
- L.A. City Standard Plan Approval No. 421
- State of New Mexico Energy and Minerals Department
- Wisconsin Safety and Building, Approval No. AE-82-25 through 28-S/C
- Metropolitan Dade County Dept. of Building and Zoning Approval for Solar Collectors No. 82-215.1
- Miami Test Lab Wind Testing, Approval No. MTL 11235
- Interim Minimum Property Standards Supplement, HUD 4930.2, 1977
- Uniform Solar Energy Code, IAPMO, 1976
- Uniform Pumping Code, IAPMO, 1981
SOLAR WATER HEATING SYSTEM TYPES

This bulletin is intended to acquaint AET Dealers and Distributors with the six primary solar water-heating systems available from AET. The system types described for tropical regions are the “D”, “DPV” and “FF.” For hard freezing climates the “I”, “IPV” and “DB” are shown. All AET systems can be sized to accommodate any load with maximized energy savings and design life.

Direct “D” System – Fig. 1
(Differential Controlled – Open Loop)

This is the type of system most common in the Southern United States and Tropical Climates. As illustrated in Figure 1, the system consists of solar collector(s) installed on the roof and a hot water storage tank usually located in the garage or utility room. An alternating current (A/C) pump circulates the water from the tank up to the collector and back. This system is referred to as direct because the sun's heat is transferred through the collector directly to the potable water. No antifreeze solution or heat exchanger is required.

The “D” System utilizes a differential control to sense the temperature differences between water leaving the collector and the coldest water in the bottom of the storage tank. The control turns the pump on when the water in the collector is about 20°F warmer than the water in the tank. Similarly, the pump is turned off when the temperature variation is approximately 5°F. This process ensures that the water is always being heated while the pump is operating.

A thermally operated valve is installed at the collector to provide freeze protection where required. This valve will open to let warm water flow through the collector whenever temperatures approach freezing. As an alternative, the collector can be manually drained by closing the isolation valves and opening the drain valves (located above the storage tank).

Indirect “I” System – Fig. 3
(Differential Controlled – Closed Loop)

The “I” System is designed to accommodate climates where freezing weather occurs more frequently. Instead of water flowing through the collector, an antifreeze solution is circulated. A heat exchanger is located within the storage tank. This maximizes the heat transfer from the antifreeze solution to the coldest water in the storage tank.

The “I” System is known as an indirect pumped system because the heat transfer solution, i.e. antifreeze, is pumped through the collector in a closed loop. It never comes in direct contact with the potable water in the storage tank. The closed loop includes the collector, connecting piping, pump, expansion tank, and heat exchanger. In this design, the large heat exchanger coil wraps around the perimeter of the storage tank.

As in the “D” System, the differential control determines when the pump should be activated and deactivated.

Figure 1. Direct (Open Loop) System. “D” System

Figure 2. Photovoltaic Direct (Open Loop) System. “DPV” System

Figure 3. Indirect (Closed Loop) System using antifreeze solution. “I” System
Indirect “IPV” System – Fig. 4
(Photovoltaic Control – Closed Loop)

The “IPV” System is similar to the “I” System except that the energy needed to power the pump is provided by a photovoltaic (PV) panel. The PV panel converts sunlight into electricity, which powers a DC pump. The transfer fluid circulates through the system only when the sun is shining.

The DC pump and PV are suitably matched to ensure optimum performance. The pump starts when there is sufficient solar radiation available to heat the thermal collector. The pumping speed increases with the increase in the amount of sunlight. This produces a flow rate matched to the level of heat transfer required. The system then shuts off when the available solar energy diminishes.

“DB System – Figure 5
(Drainback)

The “DB” System Provides a reliable method for ensuring that the collectors and their pipelines never freeze. This is done by removing all the water from the collector(s) and piping when the system is not producing heat. Freeze protection is provided when the system is in the drain mode. Each time the pump shuts off the water in the collector(s) and piping drains into the insulated reservoir tank. To allow for complete drainage the collector(s) and piping are mounted at a slight angle. A sight glass attached to the reservoir tank shows when the reservoir tank is full, indicating that the collector(s) has been completely drained.

The differential control of the “DB” System activates the pump using the same strategy as the “D” System. The solution, distilled water or antifreeze, circulates in a closed loop never coming in direct contact with the potable water in the storage tank. The closed loop includes the collector, connecting piping, pump, reservoir tank and heat exchanger. The heat exchanger wraps around the perimeter of the storage tank heating the potable water in the tank.

Thermosyphon System
“FF” System – Figure 6

The Free Flow (FF) System is widely accepted throughout the world today. It is automatic, simple and reliable. Figure 6 illustrates a typical system.

All “FF” Systems have their collector(s) positioned lower than their tank(s). As the sun heats the water in the collector it “rises” into the tank in the same way that a balloon “rises” in the air. The cold water in the tank then “sinks” into the collector. These events create a continuous process, which results in a full tank of hot water by the end of the day.

The “FF” System does not require a pump or control. Cold water flows directly to the thermosyphon tank on the roof where the water is heated. Solar heated water then flows from the thermosyphon tank to ground level where it is ready to use.

NOTE: The illustrations on the following pages detail the “minimum” plumbing requirements as recommended by the manufacturer. Local codes may warrant additional values for safety purposes. Check local codes prior to the installation of any solar domestic hot water system.

SYSTEM SIZING

Determine your location on the map. The sizing depends upon region.

To determine hot water usage – assume 20 gallons of hot water consumption per day for the first and second family members and assume 15 gallons per day for each additional family member. (i.e. 4 person family will use approximately 70 gallons per day.)

Choose next largest solar storage tank capacity necessary. Example: Family size 4, an 80 gallon storage tank is suggested.

The number of collectors and sizing will be determined from the sizing map.

INDIRECT “I”, “IPV” SYSTEMS
(Closed Loop)

The Indirect System offers excellent dependability and performance. As the sun shines on the collectors, non-toxic antifreeze is circulated through the “solar loop” by the pump and heat is transferred into the tank. The potable water in the tank never flows through the collectors. This prevents corrosion or scale buildup in hard water areas. These popular systems have proven to be dependable in installations across the U.S. and worldwide. Freeze protection is assured due to the antifreeze in collectors and exposed piping.

NOTE: For IPV (Formerly CPV) Systems, use the same chart.

DIRECT “D”, “DPV” SYSTEMS
(Open Loop)

The Direct Systems are highly efficient due to the direct circulation of water from the storage tank to the collectors. As this water flows through the “open loop” during a typical day, it is heated and then stored in the insulated tank. Systems are usually sized to deliver 15 to 25 gallons of hot water per person per day. This system performs best in moderate climates. The collectors and exposed piping are protected from freezing by a control recirculation feature that circulates warm water during freezing conditions and a fail safe thermal valve.
NOTE: For DNPV (Formerly OPV) Systems use the same chart as for D Systems on page 8.

**DRAINBACK “DB” SYSTEMS**

The Drainback System is one of the top performers in the U.S. in both total energy output and efficiency. The simple design eliminates many components. Only potable water is used in the indirect system instead of chemicals so no maintenance is required. The collectors and exposed piping drain each time the pump is turned off, assuring freeze protection.

**COLLECTOR SIZING**

In the sunbelt, zones A, B, and C you will need one square foot of collector for every 2 gallons of storage, i.e. 80 gallons of storage will require 40 square feet of collector area.

In the remaining zones D, E, and F you will need one – two square feet collector area for every 2 gallons of storage, i.e. 80 gallons of storage will require 60 square feet of collector area. In this case you will need two AE-32 (64 sq.ft.).

**SOLARIZING EXISTING WATER HEATER**

**“DX” DRAINBACK RETROFIT**

Convert existing 40/52 gallon electric water heaters or utilizing 40/52 gallon storage tanks for preheating existing gas water heaters. These systems can be expanded to a larger system by adding additional storage and/or collectors in the future.

SOLAR COLLECTORS

AE-SERIES

Since its introduction in 1987 the AET AE-Series has set a new standard in solar thermal collector excellence. Available in a wide range of sizes and models the AE collectors offer excellent performance and structural integrity. AE-Series collectors have been successfully utilized in all facets of residential, commercial and industrial applications.

MSC-SERIES

For more than twenty seven years Morningstar Collectors have been the standard of the industry to which all collectors are compared.

Coupling unparalleled durability with its unique I-Beam construction and anodized frame wall for long-term aesthetics, no other collectors available will match the MSC in overall quality.

MSC collectors feature Quick Lock mounting hardware for durable simplified mounting in any configuration.
COLLECTOR SPECIFICATIONS

AE-SERIES

Glazing: 1 sheet of High-T glass, 1/8" or 5/32" thick with 0.01% iron oxide content. Transmittance: >90.0%

Glazing Gasket: EPDM Channel with molded corners.

Insulation: 1-¼" Foil-faced poly-isocyanurate board insulation. (R-10). ¾" Foil-faced poly-isocyanurate board in side walls and under headers. (R-6).

Frame Wall and Batten: 6063 T6 Aluminum extrusion. (1/8" wall) Electrostatic paint finish. Electrostatic paint integral mounting system.

Backsheet: 0.019 stucco embossed aluminum sheet MB-40 bronze, pop-riveted to frame wall.

Fasteners: Aluminum and 18-8 stainless steel, black oxide coated for aesthetics.

Absorber Plate: Exclusively manufactured by Thermafin Manufacturing. All copper fin and tube construction. High frequency forge welded for permanent bond between tube and sheet. No soldered or crimped joints to fair from expansion and contraction. 30 year warranty on fin-to-tube joint.

Absorber Coating: Crystal Clear Absorptivity: ~0.96 Emissivity: ~0.08

Individually Leak Tested At: 150 PSI

Design Life: 30 Years

Flow Rate: 0.5 to 1.8 GPM recommended

Warranty: 10 year limited – Consult Factory

**F = CROSS FRONTAL AREA**

**G = TRANSPARENT FRONTAL AREA**
AE-MH Standard Mount

AE-MH Standard Mounting Hardware allows maximum variation in collector mounting positions. The 6063-T6 hinges are quickly locked onto the collector frame by a stainless steel locking bolt. The front hinges are fitted into heavy roof mount brackets, and the rear hinges are attached to the 1" aluminum square tube to conveniently tilt the collector at optimum position. This hardware set comes complete with all stainless steel bolts and nuts.

AE-FM Flush Mount

AE-FM Flush Mount Hardware is a time and cost saving technique that is used when mounting collectors in the same plane as the roof. Each of the four brackets is quickly locked onto the collector frame by a stainless steel locking bolt. The collector is held 3” above the roof surface to allow water and debris to flow down the roof freely. This flush mount hardware is truly an attractive and cost saving option for solar collector mounting.
AE-RM RACK MOUNT

AE-RM Rack Mount Hardware is an excellent collector attachment device for use in commercial arrays. When a site constructed collector rack is used, these clips provide a very fast and inexpensive mount. As in all AET, Inc. Hardware, a stainless locking bolt locks the clip to the collector frame. Each of the four brackets is color matched to the collector and provides a lightweight and attractive attachment.

MSC-MH STANDARD MOUNT

MSC-MH Standard Mounting hardware allows maximum variation in collector mounting positions. The 6063-T6 hinges are quickly locked onto the collector frame by a stainless steel locking bolt. The front hinges are fitted into heavy roof mount brackets, and rear hinges are attached to the 1” aluminum square tube to conveniently tilt the collector at optimum position. This hardware set can also be used in flush mount applications.

EAGLE SUN™ CLOSED (INDIRECT) STORAGE TANK

SPECIFICATIONS

Model – 80 gallon capacity.

1 – R-Foam Insulation (R-17.30) – Rigid Polyurethane foam insulation for optimized operation. Electric control is covered by fiberglass insulation for easy accessibility.

2 – Tank – EAGLE SUN™ water heater tanks are made with exacting care. The tank surface is coated with an exclusive porcelain formula and fused to the solid steel shell at 1600°. The result is a smooth, tough, glass like lining. Tank is designed and tested to withstand 300 PSI hydrostatic test pressure of 150 PSI U.L. Standard.

3 – Collector Feed and Return are located for easy access and simple connections. ¾” NPT female connections at inlet and outlet.

4 – Cold Water Inlet brings cold water to tank bottom to prevent mixing with already heated water.

5 – Anode Rod protects inner tank. Additional opening in top pan for easy access to anode rod.

6 – Cold Water Inlet, Hot Water Outlet, Relief Valve and Anode Rod are at tope of tank for easy access and fast, economical installation.

7 – Thermostat Opening ½ “ NPT opening for accurate sensing of water temperature.

8 – Heat Exchanger – Copper tubing wrapped around and secured to the tank. Double-wall, vented design for positive leak detection and foamed in place with R-Foam for efficiency.

NOTE: To prevent corrosion, proper pH levels in transfer fluid must be maintained. Refer to operation and maintenance manual.

9 – Improved Electrical Junction Box (for ½” and ¾ “ conduit) placed above heating element for easy installation. No spot welds used.

10 – Direct Immersion Heating Element is completely immersed – all the heat goes into the water. Nickel Chromium heating coil imbedded in magnesium oxide and sealed in a tinned-copper tube.

Although in direct contact with water, the ends are sealed to prevent entrance of moisture. Elements are changed, should the need arise, by screwing into special tank flanges.

11 – Automatic Temperature Control Thermostat keeps stored water at desired temperature.

12 – High Temperature Limit automatically and safely cuts off power to the element should excessive temperature occur.

Available in 80 Gallon Models

6-Year Limited Tank and Parts Warranty*

- Brass drain valve
- Choice of two models...storage tank or single element water heater, both specially equipped for installation with residential direct solar systems
- Patented R-Foam insulation process
- Temperature and pressure relief valve included
- Collector feed and return fittings located at front of tank for convenient installation
- Isolated tank design for better heat retention
- High efficiency heating element
- Rheemglas® tank lining resists corrosion and prolongs tank life
- Cold water inlet brings cold water to tank bottom to prevent mixing with heated water
- Anode rod equalizes aggressive water action for prolonged tank life
- Cold water inlet, hot water outlet, relief valve and anode rod at top of tank for easy access and fast, economical installation
- Automatic temperature control
- Over temperature protector

*See Residential Warranty Information Brochure for complete warranty information.

Energy Factor and Average Annual Operating Costs based on D.O.E. (Department of Energy) test procedures. D.O.E. national average fuel rate electricity 8.41¢/KWH.

Heaters furnished standard 240 volt AC.
Units are shipped with a 4500 watt element. If heating elements of different wattages than those shown are demanded by zone requirements, they must be specifically requested.

To prevent corrosion, proper pH levels in transfer fluid must be maintained.
Solarade models meet all current state requirements for solar storage tanks.
The tanks are Rheemglas lined and are designed to operate up to 150 PSI.

COPPER COIL DATA (Type L Copper)

EAGLE SUN™ OPEN (DIRECT) STORAGE TANK

SPECIFICATIONS

Models – 80 and 120 gallon capacities.

1 – R-Foam Insulation (R-17.3) – Rigid Polyurethane foam insulation for optimized operation. Electric control is covered by fiberglass insulation for easy accessibility.

2 – Tank – Thermo-Miser™ water heater tanks are made with exacting care. The tank surface is coated with an exclusive porcelain formula and fused to the solid steel shell at 1600°. The result is a smooth, tough, glass like lining. Tank is designed and tested to withstand 300 PSI hydrostatic test pressure of 150 PSI U.L. Standard.

3 – Collector Return is provided through dip tube at top of tank for ease of connection and efficiency.

4 – Cold Water Inlet brings cold water to tank bottom to prevent mixing with already heated water.

5 – Anode Rod protects inner tank. Additional opening in top pan for easy access to anode rod.

6 – Cold Water Inlet, Hot Water Outlet, Relief Valve and Anode Rod are at top of tank for easy access and fast, economical installation.

7 – Collector Feed Opening – Located at the top of the tank. Dip Tube prevents mixing of hot water in the top of the tank and draws cold water from the bottom of the tank.

8 – Threaded Sensor Stud – Located for positive tank sensor mounting. Low voltage sensor wire runs inside jacket and out top of tank for easy control connection.

9 – Relief Valve Opening – Located for convenient installation.

Electric Models – 80, and 120 gallon capacities.

10 – Bottom Pan is secured by a special lug on tank bottom eliminating need for sheet metal screws. The lug serves as a ground and also locks tank to pan to prevent “floating action.”

11 – Improved Electrical Junction Box (for ½" and ¾" conduit) placed above heating element for easy installation. No spot welds used.

12 – Direct Immersion Heating Element completely immersed, all the heat goes into the water Nickel Chromium heating coil imbedded in magnesium oxide and sealed in a tinned-copper tube. Although in direct contact with water, the ends are sealed to prevent entrance of moisture. Elements are changed, should the need arise, by screwing into special tank flanges.

13 – Automatic Temperature Control Thermostat keeps stored water at desired temperature.

14 – High Temperature Limit automatically and safely cuts off power to the element should excessive temperature occur.

SOLAR STORAGE TANKS WITH ELECTRIC ELEMENT

6-Year Tank Warranty
6-Year Parts Warranty

• 2” Non-CFC Foam Insulation
  Foam insulation saves fuel by retarding heat loss.

• Fused Ceramic Shield
  Applied under pressure and fired at 1600°F to completely cover the tank interior. This provides a tough interior surface for storage tanks and maximum protection against the wearing effects of high-volume and high-temperature hot water.

• Anode Rod
  Promote longer tank life through even distribution, for protection against corrosion of tank interior.

• Factory-Supplied Top Temperature and Pressure Relief Valve

• Factory-Installed Dielectric Nipples

• Pre-Wired Sensor Lead
  From storage sensor mounting stud to top of tank. Does not include sensor.

• Water Connections
  Accessible from four factory-installed 3/4” dielectric nipples located on top of tank.

• 4500-Watt Heating Element and Automatic Thermostat
  Where a back-up system is desired.

• UL Listed

---

6-Year Limited Tank Warranty
Heavy gauge steel is automatically formed, rolled and welded to assure continuous seams for Fused Ceramic Shield™ lining. Each tank is triple tested to ensure quality.

6-Year Parts Warranty
Original factory parts warranted for 6 years.

For complete warranty information consult the written warranty of American Water Heater Company at (800) 999-9515.
TACO PUMPS

003 BRONZE CARTRIDGE CIRCULATORS

CP-003BC4

FEATURES:
- Bronze casing with ½" sweat connection.
- 1/40 HP motor and head to 4 feet.

006 BRONZE CARTRIDGE CIRCULATORS

CP-006B4 and CP-006BC4

FEATURES:
- Bronze body with ½" and ¾" sweat connections.
- 1/40 HP - flows to 6 GPM and head to 9 feet.

008 CARTRIDGE CIRCULATORS

CP-008B

FEATURES:
- Bronze body available with ¾" – 1 ½" flanges.
- 1/25 HP - flows to 9 GPM and head to 17 feet.

009 CARTRIDGE CIRCULATORS

CP-009F

FEATURES:
- Cast Iron casing with ¾" - 1 ½" flanges.
- 1/8 HP - flows to 14 GPM and head to 16 feet.

CP-009B

FEATURES:
- Bronze casing with ¾" – 1 ½" flanges.
- 1/8 HP - flows to 10 GPM and head to 35 feet.
MARCH – Direct Current Pump (D/C)

SPECIFICATIONS – 12 or 24 Volt D.C. Models

March's proven magnetic drive eliminates the troublesome, old-fashioned shaft seal. There can be no seal wear, power-robbing friction or leakage through the seal. Impeller and drive magnets are permanent ceramic type. They prevent slippage and insure that full motor horsepower is converted into pumping power. Energy requirements are lowered, as all the energy produced by the motor is utilized, especially important in solar systems. March seal-less drive also provides for faster, easier motor service, as the motor can be removed without draining or refilling. Their low starting current and high efficiency make them excellent for stand-alone solar circulators.

PERFORMANCE CURVES

SOLAR CONTROLS

INDEPENDENT ENERGY

BENEFITS:
One Unit Does Work of Many
System Performance Tuning Capability
Wider Versatility Of Applications
Instant Status Feedback Of System Operation
Quick Plug-In System Monitoring Capability
Fast, Easy Installation
Lighting And Static Electricity Protected
Proven Reliability

The advanced electronic control for today’s sophisticated solar systems. The Goldline GL-30 Differential Temperature Control is designed to provide maximum operating and flexibility to effectively manage today’s innovative solar energy systems. The GL -30 is capable of handling most differential temperature control functions for operation of domestic water heating and sophisticated space heating and cooling. It is especially well suited for Antifreeze, Drainback and Re-circulate type solar heating systems.

Ease of installation, operation and serviceability
The GL -30 Differential Temperature Control is designed to meet your needs for ease of installation, operation and serviceability. The GL -30 offers you advanced operating features to provide differential temperature control, storage high limit and re-circulate freeze protection functions for solar energy systems.

GL-30 output is designed to directly operate a circulator or fan for heat collection purposes when the controller is sensing and appropriate temperature differential. An LED output indicator is provided as an aid for troubleshooting or servicing the system.

Adjustable differential within a range of 8°F to 24°F. Offers versatility to tailor controls to a specific system design. Systems with long piping may require a higher turn-on differential temperature. Open loop systems with short piping runs may require a lower turn-on differential for optimum performance.

Storage high limit is field adjustable over a 100°F to 230°F range. Offers flexibility to protect most types of storage systems.

Re-circulate freeze protection turns the GL -30 output “on” to circulate warmer storage water through the collector(s) when near freezing temperatures are reached at the collector sensor. LED re-circulate freeze indicator provides instant output status of this condition.

Test switch forces the GL -30 output “on” or “off.”

Connecting the GL -30 to a Goldline TD-CM digital monitor for added capability. The GL -30 contains a quick plug-in adaptor for easy connection to a Goldline TD-CM snap-in digital monitor. This combination provides a digital readout of unprecedented 1 temperature accuracy for maximum operating efficiency. When used with a digital monitor, an auxiliary sensor may be wired to the GL -30 to monitor system performance, with min./max/temperature memory. The TD-CM may be snapped into the cover of GL -30 or mounted remotely by using an ABC 10F/10M cable and MK-1 or MK-2 mounting bracket.

Goldline digital monitors may be connected as permanent installations or used as convenient carry-along troubleshooting tools to plug into a GL -30 control, read collector and storage temperature sensors and speed the service on any job.

OEM Series Solar Modules
SunWize® OEM modules deliver top-quality performance for all photovoltaic applications including rural electrification, water pumping, and general battery charging. Ideal for AC and DC installations, SunWize OEM modules can be used in single-module and multiple-module systems. Each module consists of 36 solar cells connected in series providing maximum charging power. The glass surface is impact resistant and allows maximum light transmission. Single crystalline solar cells are encapsulated and bonded to the glass in multiple layers of ethylene vinyl acetate (EVA) and laminated with a white Tedlar™ backing insuring long life in severe environmental conditions. Bypass diodes contained within the junction box insure reliable operation. Anodized aluminum tubular frames add strength and durability to the modules. Includes pre-drilled mounting holes. The weather resistant junction box accommodates all wiring methods including moisture-tight strain relief connectors and electrical conduit. SunWize modules carry a 20-year, 80% power output warranty. FM approved.

COLLECTORS

For maximum cost efficiency and reliability you won’t find a better collector than those manufactured by Alternate Energy Technologies. Each collector is carefully crafted under strict quality control management. Careful design and assembly ensure that your collector will be aesthetically pleasing and structurally sound.

These collectors come in six different size configurations to optimize for job type or container shipping:
(all collectors are 7.94 cm deep)

</table>

All collectors have been tested under ASHRAE 93-86 conditions and yield the following efficiency equation:

Eff. = 76.5 – 413(Ti-Ta)/I

Where units of (Ti-Ta)/I are in °C/Watt/m².

When it comes to packaging these into containers the following applies:

SKD – COLLECTOR KITS

In many countries a great door is opened if the collectors are assembled by local labor. Import restrictions are often waved, and local economies benefit from the jobs created from the assembly of the collectors. SKD collectors come in all of our mentioned models. SKD collectors are not assembled, and do not have insulation supplied. Collectors are totally pre-manufactured to the same exacting tolerances of standard collectors, and may be assembled with simple hand tools. Larger numbers of SKD collectors may be shipped in a container than standard collectors; thus, lowering the landed cost. SKD collectors themselves are priced lower than standard collectors as well. This is the preferred method of import by many of our international clients.

GLASS

AET is one of the largest outlets for High-T Tempered Solar Glass in the World. Years of experience has shown that there is no substitute for tempered low iron glass. It has the durability and longevity needed for any solar application. It provides 90% transmission (at 0° incidence angle and 0.3175 cm thick) of solar radiation, and is opaque to infrared. We can supply your replacement glass needs or simply supply the highest quality glazing for collectors of your own manufacture. We have readily available the following 5 sizes:

Custom sizes are available.
ABSORBER PLATES

The absorber plate/riser tube assembly is available in the following sizes (custom sizes are regularly done):

**AP-40**, 118.625 x 45, 28 lb.
**AP-32**, 94.625 x 45, 23 lb.
**AP-28**, 82.625 x 45, 20 lb.
**AP-26**, 74.625 x 45, 19 lb.
**AP-24**, 94.625 x 33, 17 lb.
**AP-21**, 82.625 x 33, 16 lb.

The riser tubes are 1.27 cm ID. These are available with header tubes of both 2.54 cm ID and 3.81 cm ID or no header tube. Other size header tubes are available upon request.

FRAME & HARDWARE

AET uses only extruded aluminum in all of its collector frame types. It is available in two different standard profiles, and is available in custom sizes. Both electrostatic paint and anodized finishes are available. Mounting hardware is also from aluminum extrusions and is used with stainless steel fasteners. The mounting hardware and the frames are designed to interlock without penetrating the frame wall or the use of power tools. Simple hand tools are used to lock the hardware in place on the frame. Mounting hardware is available for mounting to racks, flush roofs, and hinged configurations.

Years of experience have taught AET that steel and other ferrous metals simply cannot withstand the environmental pressures of heat, moisture, and wind induced stress over time. When properly assembled our frames (when glazed with our tempered glass) can withstand wind induced pressure differentials of in excess of 4 kPa. This translates into a wind velocity of 280 km/h with no damage.

All AET frames and hardware configurations are available for export.

MANUFACTURING PARTNERSHIPS

AET offers a flexible program to assure the successful entry into the solar thermal manufacturing business. The staff of AET has many years of experience in the worldwide export of solar thermal technology, components and factory-packaged systems.

AET is ready to assist your business in:

- Collector Kits Set-up Program.
- Joint Ventures.
- Full Engineering Support Services.
- Sale of Manufacturing Equipment, Fixtures, and Jigs.
- Sale of Technology.
COMMERCIAL SYSTEM PACKAGING

AET has equipment on commercial projects in: Algeria, Antigua, Bahamas, Belize, Bolivia, Canada, Columbia, Egypt, England, Guatemala, Iraq, Jordan, Korea, Lebanon, Lesser Antilles, Mexico, Morocco, Nepal, USA, & Confederation of Independent States. AET supplies complete engineering services for the design of all types of heat energy delivery systems ranging to agricultural drying, poultry process heat, domestic/commercial service hot water, reheat in air conditioning for humidity control, space heating, and any application requiring heat energy in the 50°C to 100°C range.

Our methodology for commercial applications follows:

A viable site/application is selected. Feasibility study is performed to determine approximate costs and thermal deliverables.

An engineering study is conducted at the expense of the potential end-user to generate the actual design of the system and develop actual cost figures. Financing is secured either via end-user capitalization or third party financing/leasing. Complete proposal is made to the end-user. Funds are delivered. All equipment is delivered to site. Construction oversight is provided by AET engineer(s). Maintenance documentation is generated and delivered to the site manager.

AET will provide these services worldwide.
APPENDIX E: ALTERNATE ENERGY TECHNOLOGIES, LLC (AET) FULL TEN YEAR
WARRANTY ON THE MORNING STAR & ALTERNATE ENERGY SOLAR COLLECTORS

1.) SCOPE OF COVERAGE
This warranty applies to a new solar collector purchased by the end user. The warranty covers the collector as a whole including all of its components and parts. It extends to the first buyer and to any subsequent owners of the system for a total of Ten (10) years.

2.) WARRANTY ON THE COLLECTOR
Alternate Energy Technologies, LLC (AET) warrants fully it’s solar collectors to be free from defects in both material and workmanship for a total period of ten years from date of installation acceptance by the original owner. If a failure does occur during the warranty period, AET will provide a new part, or at AET’s option, have repaired any part of the collector. A new warranty shall apply to any replacement part, but shall be limited in time to the remainder of the original warranty period. This warranty applies to collectors installed for use as a heat collector to provide energy for use in medium temperature range applications (110 to 210 degrees Fahrenheit) only.

3.) SERVICE LABOR RESPONSIBILITY
This warranty covers labor expenses for removal and reinstallation. AET will pay up to sixty dollars ($60.00) per collector for such expenses.

4.) ABSORBER SURFACE
AET warrants fully for a period of ten years against and degradation of the absorber surface which would significantly affect the collector performance.

5.) WARRANTY EXCLUSIONS:
A.) This Warranty Will Not Apply To The Following Exclusions
   1.) To defects or malfunctions resulting from failure to properly install, operate or maintain the collector.
   2.) To damage from abuse, accident, fire, flood, hail, wind or other acts of God.
   3.) To glass breakage.
   4.) To collector failure which occurs due to damage caused by heat transfer fluids.
   5.) If the collector is moved from the original installation location.
   6.) When the collector is installed as a roof membrane or as an integral part of an existing roof membrane.
   7.) To damage cause by freeze.

B.) Limitation on Exclusion from Coverage
Conditions that may occur in the normal operation of the collector shall not be invoked by AET to reduce the coverage of this warranty.

6.) OTHER RIGHTS AND REMEDIES
A.) Consequential and Incidental Damages
AET shall not be liable for: (1) Consequential damages to the system in which the improperly functioning collector is installed, and (2) Incidental expenses incurred to repair or replace, as necessary, any other obligations or liability in connection with the collector.

B.) No Other Expressed Warranties
Unless otherwise explicitly agreed in writing, it is understood that these are the only written warranties given by AET, and AET neither assumes nor authorizes anyone to assume for it any other obligations or liability in connection with the collector.

C.) Implied Warranties
This warranty gives you specific legal rights, and you may also have other rights which vary from state to state.

D.) Right to Arbitration
Any dispute between the buyer and AET pertaining to this warranty may, at the option of the buyer, be resolved by arbitration in the state installed according to the rules of the American Arbitration Association.

E.) Right to Indemnity
AET will fully indemnify a licensed contractor who installs the collector and gives a written warranty as required by the California Solar Tax Credit Regulations, in the amount of any liability to the buyer under such warranty for a breech that is also a breech of the Manufacturer’s warranty to the buyer.

7.) FILING A CLAIM
All claims should be filed with the contractor or the Dealer from whom the collector was purchased. If unable to do so, please contact: ALTERNATE ENERGY TECHNOLOGIES, LLC (AET) P.O. BOX 61326 · JACKSONVILLE, FL 32236
